

NEUROTOXICITY

Tremor, headache, burning sensation in hands and feet (usually during the first week of therapy)

- **Reducing the dosage** of immunosuppressant or discontinuing these drugs. However, some patients have experienced permanent or even fatal neurological damage even after dose reduction or discontinuation. **CsA-sparing and tacrolimus-sparing** drug regimens that use the immunosuppressant **mycophenolate mofetil**, which has no neurotoxic effects, may reduce the incidence and severity of neurotoxic adverse events while maintaining an adequate level of immunosuppression. ^[1]
