

MIGRAINE INDUCED VOMITING

- There was no correlation between the migraine attacks and cyclosporine level
- Cyclosporine-associated headache may **not respond to simple analgesics**
- The **migraine did not respond to ergotamine or sumatriptan**
- **Beta blockers, such as propranolol**, may be beneficial
- Recognizing these individuals and possibly substituting **tacrolimus** for cyclosporine at an early stage may save a renal graft ^[1]
