

OPHTHALMIC

TACROLIMUS INDUCED OPTIC NEUROPATHY (TION)

TION is a rare complication after transplantation. It can occur at any tacrolimus level and at any time after transplantation

Management:

- Tacrolimus should be stopped if possible. If not, tacrolimus can safely be reduced if Everolimus is added to maintain adequate immunosuppression.
- In addition, prompt and aggressive control of inflammation by steroids is recommended. ^[10]
